

New dry belt lubrication concept,

**calgonit Dry Glide system,**

successfully introduced into the European market.

The new dry belt lubrication concept, the calgonit Dry Glide system, has been successfully introduced into the European market.

After the start of sales in the summer of 2007 the well thought-out overall concept, consisting of high-quality and reliable dosing technology and a lubricant system with clear application advantages over the competitors' existing products, made a very rapid impact.

In no time at all quite a few systems had already been installed and successfully commissioned throughout Europe, predominantly in the PET conveyor sector. Interest has now become so great that a not inconsiderable number of orders for similar systems have already been received by Calvatis.

The hurdle of transposing dry belt lubrication to the previously inaccessible area of glass / stainless steel was also successfully cleared in February this year, and the patent was applied for.

In this regard, the sorting unit of a non-returnable glass system was converted for a long-term practical test and has been running fully operationally with no problems since November.

The great response to the Calvatis presentation in the context of the spring conference of the VLB (Research and Teaching Institute for Brewing) in March 2008 in Kulmbach showed clearly the major interest and potential that there is in this topic. We are convinced that with the calgonit Dry Glide system we offer the optimum solution on the market for dry belt lubrication for all types of conveyor belt and packaging.

Should you have any further questions please feel free to contact us at any time.
